

STOP & DRAIN OR STOP & WASTE VALVE

Many homes use this valve as a shut off to their house. These valves work great to drain the water from your house when turned off to avoid frozen pipes. The downside is as the valves get older they become harder to operate and if they are not opened or closed completely water will bleed out of the drain hole. Most of these valves are under your house with a shut off key coming through the floor and you can't see the valve so you don't know if it is bleeding by.

**This is the drain hole. If the valve is not closed or opened all the way water will bleed out of the drain hole.
